

DESCRIPTIVE TITLE OF THE INVENTION

SELF-SIZING SUN VISOR

5

BACKGROUND OF THE INVENTION

10 1. Field of the Invention

The present invention relates to an improved construction of a self-sizing sun visor, capable of fitting wearers having a plurality of head sizes. The visor includes an open crown portion including a biaxially stretchable headband, a visor portion connected to the front of the headband and a sweat absorbing foam liner attached to the inner surface of the headband. The biaxially stretchable headband and the sweat absorbing foam liner attached to the inner surface of the headband allows the visor to fit onto the head of the wearer without uncomfortable circumferential pressure.

20 2. Description of Related Art

Visors are well known in the art and come in many configurations. They include a headband with an open crown to fit onto a wearer's head and a visor or bill portion attached to the front of the headband.

25 There are many different types of visors that have been available over the years. In order to fit a plurality of head sizes prior art visor headbands took the form of a rigid headband with an open back end, a stretchable continuous loop headband or a headband with wearer adjustable overlapping straps.

The desired level of comfort and easy of use to the wearer has not been achieved in the prior art visors which incorporate some type of stretchable fabric headband. The visor causes undue compressive pressure around the head of the wearer thereby causing discomfort to the wearer and even resulting in a mark being left on the wearer's skin.

5 An objective of the present invention is to overcome the disadvantages of the prior art by providing a custom-fit, comfortable visor having no adjustable straps at the back thereof and yet is capable of accommodating a plurality of various sized heads. It is a further objective of the present invention that it can be manufactured easily, utilizing conventional materials and fabrics.

Yet another objective is a visor that is both functional and attractive in its use and appearance.  
10 necessary for a retailer to maintain in order to accommodate a plurality of various sized heads.

#### BRIEF SUMMARY OF THE INVENTION

The invention is a self-sizing sun visor. The self-sizing sun visor includes a headband.  
15 The headband has one or more layers of material. The headband is shaped as an elongated four-edge band and has an upper edge, a lower edge, a first edge, a second edge, a forward headband midpoint, an inner surface, an outer surface and a first predetermined width. The headband is constructed from one or more elongated rectangular pieces. The first edge of the headband is attached to the second edge of the headband, thus forming a headband with an inner surface, an  
20 outer surface and a circumferential linear extent of a first predetermined length. The headband has an upper peripheral edge and a lower peripheral edge.

A visor of an essentially rigid nature is attached to the forward portion of the lower peripheral edge.

In a variation of the invention the headband is at least uniaxially stretchable.

25 In another variant of the invention, the headband is at least biaxially stretchable.

In yet another variation of the invention, a sweat absorbing foam liner is attached to the inner surface of the headband to facilitate a comfortable snug fit.

In still another variation of the invention, the first predetermined length of the headband is a short length sized to fit small to medium size heads comfortably.

5 In a distinct variation on the invention, the first predetermined length of the headband is a long length sized to fit large to extra large size heads comfortably.

In another distinct variation on the invention, the headband is made from a stretchable cotton and spandex blend.

10 In another distinct variation on the invention, the first predetermined width of the headband decreases from a maximum width at the forward headband midpoint to a minimum width at the aft midpoint of the headband.

In still another distinct variation on the invention, the predetermined width of the headband increases from a maximum width at the aft headband midpoint to a minimum width at the forward midpoint of the headband.

15 In another distinct version of the invention, at least one edge of said elongated four-edge band is curvilinear.

In still another distinct version of the invention, at least one edge of said elongated four-edge band is straight.

20 In yet another distinct variation on the invention, the headband is created from one or more headband segments. The headband segment is shaped as an elongated four-edge band with an upper edge, a lower edge, a first edge, a second edge and a first predetermined width. The first edge of the headband segment is attached to the second edge of an adjacent headband segment and so forth to create a closed loop one or more piece, one or more layer headband. The

headband has an inner surface, an outer surface and a circumferential linear extent of a first predetermined length.

In another version of the invention, the sweat absorbing foam liner is attached to the inner surface of the headband with stretchable thread.

5 In a different version of the invention, a headband segment is a different color or the same color as the other headband segments.

In yet a different version of the invention, a headband segment is sweat absorbent or non-sweat absorbent.

10 In still a different version of the invention, the headband is capable of construction from a mixture of more than two headband segments. The mixture including a uniaxially stretchable segment, a biaxially stretchable segment and or non-stretchable segment.

In another distinctive version of the invention, at least one edge of said elongated four-edge band is curvilinear.

15 In still another distinctive version of the invention, at least one edge of said elongated four-edge band is straight.

## BRIEF DESCRIPTION OF THE DRAWINGS

**Figure 1** is an orthogonal view from the bottom looking upwards into the inside of the visor.

## DETAILED DESCRIPTION

20 As shown in **Figure 1**, the invention is a self-sizing sun visor **10**. The self-sizing sun visor **10** includes a headband. The headband **14** has one or more layers **16** and **20** of material. The headband **14** is shaped as an elongated four edge band and has an upper edge, a lower edge, a first edge **18**, a second edge **22**, a forward headband midpoint **32**, an inner surface **26**, an outer

surface and a first predetermined width. The headband is constructed from one or more elongated rectangular pieces. The first edge of the headband is attached to the second edge of the headband, thus forming a headband with an inner surface, an outer surface and a circumferential linear extent of a first predetermined length. The headband has an upper peripheral edge and a lower peripheral edge **42**.

A visor **46** of an essentially rigid nature is attached to the forward portion of the lower peripheral edge **42**.

In a variation of the invention the headband **14** is at least uniaxially stretchable.

In another variant of the invention, the headband **14** is at least biaxially stretchable.

In yet another variation of the invention, a sweat absorbing foam liner **50** is attached to the inner surface **26** of the headband to facilitate a comfortable snug fit.

In still another variation of the invention, the first predetermined length of the headband **14** is a short length sized to fit small to medium size heads comfortably.

In a distinct variation on the invention, the first predetermined length of the headband **14** is a long length sized to fit large to extra large size heads comfortably.

In another distinct variation on the invention, the headband **14** is made from a stretchable cotton and spandex blend.

In another distinct variation on the invention, the first predetermined width of the headband **14** decreases from a maximum width at the forward headband midpoint **32** to a minimum width at the aft midpoint **38** of the headband.

In still another distinct variation on the invention, the predetermined width of the headband increases from a maximum width at the aft headband midpoint **38** to a minimum width at the forward headband midpoint **32**.

In another distinct version of the invention, at least one edge of said elongated four-edge band is curvilinear.

In still another distinct version of the invention, at least one edge of said elongated four-edge band is straight.

5 In yet another distinct variation on the invention, the headband **14** is created from one or more headband segments. The headband segment is shaped as an elongated four-edge band with an upper edge, a lower edge, a first edge **18** and **34**, a second edge **22** and **30** and a first predetermined width. The first edge **18** of the headband segment is attached to the second edge **30** of an adjacent headband segment and so forth to create a closed loop one or more piece, one  
10 or more layer headband **14**. The headband **14** has an inner surface **26**, an outer surface and a circumferential linear extent of a first predetermined length.

In another version of the invention, the sweat absorbing foam liner **50** is attached to the inner surface of the headband with stretchable thread.

15 In a different version of the invention, a headband segment is a different color or the same color as the other headband segments.

In yet a different version of the invention, a headband segment is sweat absorbent or non-sweat absorbent.

In still a different version of the invention, the headband is capable of construction from a mixture of more than two headband segments. The mixture including a uniaxially stretchable  
20 segment, a biaxially stretchable segment and or non-stretchable segment.

In another distinctive version of the invention, at least one edge of said elongated four-edge band is curvilinear.

In still another distinctive version of the invention, at least one edge of said elongated four-edge band is straight.
